ELECTRONIC VALVE SPECIFICATIONS
SPECIFICATION CV 4046
ISSUE 2. DATED 1.11.56

AMENDMENT NO.3

PAGE 2.

GROUP B.

Grid Voltage. Amend Limits Min. from 9.8 to 12
" Limits Max. from 18.2 to 20

Screen Current. Amend Limits Max from 5.0 to 2.5

GROUP C

Inner Amplification Factor.
Amend Limits Min. from 5.25 to 4.0
" Limits Bogey from 6.5 to 5.25
" Limits Max from 7.75 to 6.5

March 1960 Royal Radar Establishment.
N.16633

MINISTRY OF SUPPLY (D.L.R.D.(A)RAE) VALVE ELECTRONIC

CV4046

Specification MOS(A)/CV.4046 Issue 2 Dated 1.11.56 To be read in conjunction with BS.448, BS.1409 and K.1001	SECURITY	
	Specification UNCLASSIFIED	**Valve** UNCLASSIFIED

→ Indicates a change

TYPE OF VALVE	-	Reliable Double Tetrode beam power amplifier
CATHODE	-	Indirectly heated
ENVELOPE	-	Glass, lower portion in metal shell
PROTOTYPE	-	CV.415

MARKING

K1001/4

BASE

BS448/B9G

RATING
(All limiting values are absolute)

			Note
Heater Voltage	(V)	6.3	B
Heater Current	(A)	1.6	
Max. Heater-Cathode Voltage	(V)	±150	
Max. Operating Anode Voltage	(V)	400	
Max. Anode Voltage (Ia = 0)	(V)	500	
Max. Dissipation per Anode	(W)	8.0	
Max. Operating Screen Voltage	(V)	400	
Max. Screen Voltage (Ig2 = 0)	(V)	425	
Max. Screen Dissipation (Both Screens)	(W)	3.0	
Mutual Conductance	(mA/V)	3.9	A
Inner Amplification Factor (μg1g2)		6.5	A
Anode Impedance	(kΩ)	100	A
→ Max. Grid 1 - Cathode Resistance for Cathode bias	(kΩ)	100	
→ Max. Grid 1 - Cathode Resistance for fixed bias	(kΩ)	50	
Max. Bulb Temperature	(°C)	225	B
Max. Shock (Short Duration)	(g)	500	
Max. Acceleration (continuous operation)	(g)	2.5	
Max. Operating Frequency for Full Ratings	(Mc/s)	200	
Max. Mean Cathode Current (per section)	(mA)	60	
Max. Peak Cathode Current (per section)	(mA)	375	

CAPACITANCES (pF)

C in (nom.)	)	9.0
C out (nom.)	) (per section)	7.5
Ca,g1 (nom.)	)	0.05
Ca',a" (nom.)		0.3

CONNECTIONS

Pin	Electrode	
1	Heater	h
2	Grid (1)	g'1
3	Cathode + BP	k +bp
4	Anode (1)	a'
5	Scr.(1) + Scr.(2)	g'2+g"2
6	Anode (2)	a"
7	Cathode + BP	k +bp
8	Grid (2)	g"1
9	Heater	h

DIMENSIONS

See K1001/A1/D2 with the following exceptions

Dimensions (mm)	Min.	Max.
E	-	70
P	-	41
Q	-	45

MOUNTING POSITION

Any

NOTES

A. Measured at Va = 250V, Vg2 = 135V, Ia = 30 mA.

B. Caution to Electronic Equipment Design Engineers: Special attention should be given to the temperature of valves to be operated in aircraft. Reliability will be seriously impaired if the maximum bulb temperature is exceeded. The life expectancy may be reduced if conditions other than those specified for life tests are imposed on the valve and will be reduced appreciably if absolute maximum ratings are exceeded. Both reliability and performance will be jeopardised if heater voltage ratings are exceeded: life and reliability performance are directly related to the degree that regulation of the heater voltage is maintained at its centre-rated value.

Z.13146.R.

To be peformed in addition to those applicable in K1001

Tests shall be performed in the specified order unless otherwise agreed with the Inspecting Authority

NOTES - See Overleaf

CV4046

NOTES

1. For the purpose of this test the heater and cathode shall be strapped and considered as one electrode.

2. Test to be performed on each section in turn. In the section not under test g1 = -50 volts, except where otherwise stated.

3. Test in Class C amplifier at frequency = 100 Mc/s. Duration of test = 5 minutes. Final emission test to be performed immediately after output power test.

4. Heater positive and negative successively.

5. Prior to this test the valve shall be pre-heated for 5 minutes under test conditions. Ig1 shall not be rising or out of limit, after a total of 10 minutes.

6. The valve shall be mounted so that the direction of vibration is parallel to the minor axis of the electrode structure.
Vibration frequency = any fixed frequency in the range 25 - 100 c/s. Min. peak acceleration = 2g. The test shall be of sufficient duration to obtain a steady reading of noise output.

7. Vibration and Resonance Noise Test. See drawing on page 6.

8. Valves shall be vibrated in each of the three planes, for not less than 30 hours. (100 hours total).

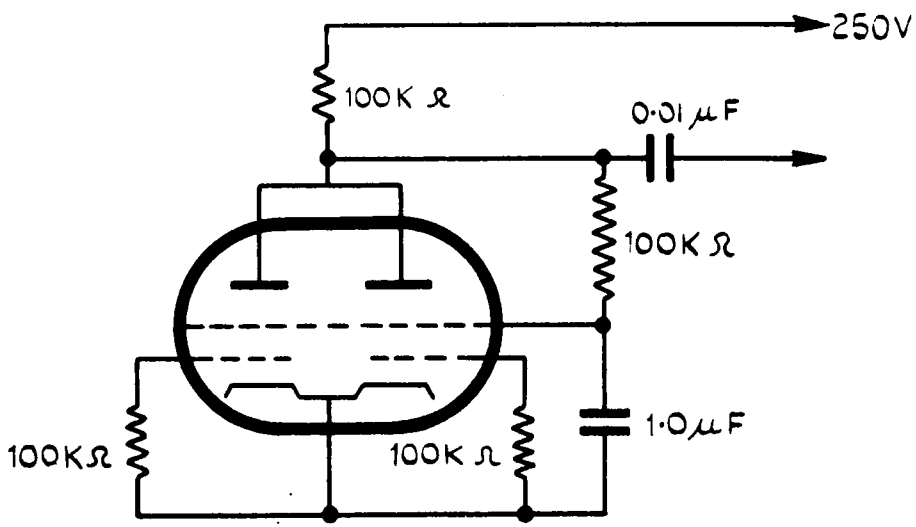
9. Test in Class C amplifier at frequency = 100 Mc/s. Anode and screen grid supplies modulated not less than 90% at 400 ± 100 c/s. Va = 320V; adjust Vg2 to give Ia = 80 mA.
The valves shall be switched off and allowed to cool for not less than 10 minutes at least twelve times in every 24 hours. During the "on" period of the heaters the H.T. is to be applied for 20 minutes in each hour of this "on" time. The accumulated heater operating time constitutes the total life test time. ←

10. Measured unmodulated.

11. To be performed under the following conditions.
Vg1 = 0; Va +g2 = 400V pulses 2 μsec. long. 50 c/s repetition frequency.

12. Gas current shall not exceed 3 μA.

13. Vh = 5.7V; Va +Vg2 = 250V; Vg1 = -100V d.c. plus 100V peak 50 c/s sinusoidal a.c. ←



VIBRATION AND RESONANCE NOISE TEST CIRCUIT
